

## COMMENCEMENT OF DRILLING AT WESTMINSTER

Truscott Mining Corporation commenced an RC infill drilling program at its 100% owned Westminster Project at Tennant Creek, Northern Territory on the 18<sup>th</sup> November 2009.

Truscott's Westminster Project is located just west of the Tennant Creek Township in the heart of the Tennant Creek Gold Field. The strategically located project hosts an intensively mineralized shear zone over 1.5 km in length. Previous drilling defined a series of structurally controlled mineralized shoots dipping in a north easterly direction (Figure1). The repetitious nature of the mineralized shoots provides the potential for the development of a single large scale underground mine with a centrally located production shaft.

The first phase of the infill drilling program will target extensions to the better defined near surface poly-metallic mineralization and then step out to drill the deeper zones down plunge. The field typically exhibits strong mineral zoning with a transition to higher gold grades below copper and base metal zones.

**Competent Person:** The contents of this report, that relate to geology and exploration results, are based on information reviewed by Ivan Henderson, who is a Member of the Australian Institute of Geoscientists. He has sufficient experience relevant to the style of mineralisation and types of deposit under consideration and to the activity being undertaken to qualify as a "Competent Person", as defined in the 2004 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Ivan Henderson consents to the inclusion in this report of the matters compiled by them in the form and context in which they appear.
